

R.I.P. Windows 2000 Server

**Support for Windows 2000 Server ends in July
Continued use will put your businesses at risk**

Increased vulnerability

Windows 2000 Server is fast approaching End-of-Life (EOL) status. This means Microsoft will stop providing patches and security updates, making the software unstable, unreliable, or insecure.

Upgrade to Windows Server 2008

If you're running this ageing operating system, you should consider upgrading as soon as possible. The latest Windows Server 2008 R2 delivers new functionality and powerful improvements that improve security, save time, reduce costs, and provide a solid foundation for your Autopart management system.

What are the dangers?

As part of its lifecycle support policy, Microsoft regularly issues updates and fixes to its software which keep its products current. These include updates, system administration tools, drivers, and additional components. When a product reaches End-of-Life (EOL), Microsoft stops issuing updates, which can make the operating system unstable, unreliable, or insecure. Antivirus and security software becomes ineffective and your entire corporate infrastructure becomes vulnerable. Even if the technology is performing well now, without access to security updates and fixes, companies that continue to use EOL operating systems put themselves at the mercy of hackers and virus writers.
